

Ticket Tools: Annotate Embed Short

Programmed Result of Tool:

This tool will read the IDENTITY_DESCRIPTION_SHORT parameter value of the selected element and create a simple text string with leader for that element.

Steps to Perform tool Operation:

The user selects the tool, then clicks the element and a text note is automatically added for that element.

- 1) User clicks the Annotate Embed Short icon.
- 2) User selects the desired element for a text note to reference.
** must use tab-select to get to the embed if it is nested into a connection family
- 3) User adjusts the location and bounding box of the text string as well as the leader points as desired after placement.

Known Limitations:

- This tool utilizes the information within the parameter IDENTITY_DESCRIPTION_SHORT and therefore this parameter must exist and be populated within the selected element.
- This tool creates a standard text note and will therefore not automatically update should the information within the element change. In order to update the information in the text note, it must be performed manually, or the text string deleted and the tool run again to generate a new text note.
