

Family Tools: Family Updater (Typical)

Programmed Result of Tool:

These tools will open a dialog from which the user can select if the family is a Precast Manufacturer Standard item, a custom item for the project, or a Manufactured Product (bought and shipped to plant). This tool also prompts the user to determine if the family makes use of the EDGE finish parameters. The result of this tool is an updated family (absolutely new, or previous EDGE family version) with the appropriate parameters mapped and data applied.

Steps to Perform tool Operation:

The user selects the tool which refers to the specific component family type to be updated. The user is then prompted (for most families) to determine if the family is to include finish parameters.

- 1) User clicks the desired Family Updating icon.
- 2) The user then determines if the family is to include finish parameters.

Known Limitations:

- This tool works preexisting families and new families alike. However, for parameters to be updated to new/current EDGE parameters, the parameter name must be coded into the software. Therefore, there may be leftover parameters or blank parameter values if the preexisting family utilized nonstandard parameters or parameters which are not coded into the software.
- This tool requires at least one named Type exist in the family. If one does not exist, a new one is created automatically.
