

Assembly Tools: Mark Assembly Reinforced

Programmed Result of Tool:

This tool will mark the selected assemblies as reinforced and update the Ticket Manager parameters with the Initial Reinforcing Date/Username as well as the Current Reinforcing Date/Username. This tool will also turn on the TICKET_FLAG parameter if the Assembly is Marked as Reinforced after ticket drawings are started and/or completed.

Steps to Perform tool Operation:

The user can preselect an assembly (or multiple assemblies) and the tool will perform its operations on each of the selected assemblies one after the other until all have been processed.

- 1) User clicks the Mark Assembly as Reinforced icon.
- 2) If no assemblies have been preselected, the user selects the assemblies (multiple selections are allowed) to perform the operation upon.

Known Limitations:

- This tool requires the selection of an assembly or multiple assemblies to perform the action. Therefore, this tool should be run from a model view rather than a ticket view where permissions to update the model may be limited by Revit.
