

Ticket Tools: Ticket BOM Duplicate Schedules

Programmed Result of Tool:

This tool will create a set of schedules using duplicated schedules for the current assembly and automatically add them to the sheet in the location(s) provided by the user. Separate schedule views are created for the various types of schedules needed in the ticket (counts, material takeoffs, and etc.). These schedules will appear under the Schedules container in the Project Browser.

Steps to Perform tool Operation:

The user selects the tool, then is prompted for location of the first parts list to be added to the sheet view.

- 1) User clicks the Ticket BOM (Duplicates Schedules) icon.
- 2) User clicks to provide the location of the individual parts list.

Known Limitations:

- This tool requires template schedules from which the new schedules will be modeled.
- This tool requires that elements have the CONSTRUCTION_PRODUCT_HOST parameter and its data must match the Assembly Mark Number parameter value.
- This tool requires that elements to be scheduled have the parameter MANUFACTURE_COMPONENT and it be populated with data.
