

User Settings: Ticket BOM Settings

Programmed Result of Tool:

This tool will provide users an interface to allow them to map which schedule suffix will be used to generate a duplicated schedule from the template schedule.

Steps to Perform Tool Operation:

This tool allows users to specify which schedules and note schedules should be duplicated by the Ticket BOM Duplicate Schedules command.

- 1) Users will run the Ticket BOM Settings tool under the Admin menu.
- 2) Users can use the "Add Row" button to add new mappings into the list.
- 3) In the Template Schedule field, users should type in the name of the schedule that should be used as the template to be duplicated.
- 4) In the corresponding Assembly Suffix field, users should type in the suffix they would like their duplicated schedule to receive. The duplicated schedule will be named with the following naming convention: ZZ_"ASSEMBLY CONTROL MARK"_"ASSEMBLY SCHEDULE SUFFIX"
- 5) Users can also click on each line item in the list to make modifications. Also, when a line item is selected a "Delete" button will appear and the entire line item can be removed from the list.
- 6) Once all schedule mappings have been specified by the user, the user should "Save". A settings file will be saved to the folder path defined in the EDGE Preferences Settings. If a folder path has not been specified, the file will be saved to C:/EDGEforREVIT.

The file will be named as follows: "project manufacture"_Ticket_BOM.xml

Known Limitations:

- The Assembly Suffix Column is required to be blank for a schedule that is a note type. If the user leaves the suffix column blank we will consider the schedule to be a note type, and the schedule will not get duplicated.
